Designing Organizations That Are Built to Change

As the pace of globalization and social change quickens, executives are correctly calling for greater agility, flexibility and innovation from their companies. Largely ignored in these pleas, however, is the simple fact that organizations have been designed to

seek sustainable competitive advantages and stability. Indeed, buried deep in the managerial psyche, and bolstered by decades of theory and practice, is the assumption that stability is not only desirable and effective but also attainable.

In their classic book *The Social Psychology of Organizations*, Daniel Katz and Robert L. Kahn note, “One can define the core problem of any social system as reducing the variability and instability of human actions to uniform and dependable patterns.” The popularity of process improvement efforts, from total quality management to Six Sigma programs, provides ample evidence of the consuming desire for stability and predictability in today’s organizations. In fact, those are the very qualities rewarded by the financial markets.

It is not surprising, then, that most large-scale change efforts fail to meet their expectations. A major problem is that many of those efforts have focused primarily on developing more effective change models or seeking the latest approach for overcoming resistance to change. But even the most advanced change models will stumble when they face organizational designs and management practices that are inherently anti-change.

The truth is that the effectiveness of change efforts is largely determined by organizational design, or how a company’s structure, processes, reward systems and other features are orchestrated over

time to support one another as well as the company’s strategic intent, identity and capabilities. In a world that is perpetually changing, an organization’s design must support the idea that the implementation and re-implementation of a strategy is a continuous process. However, a number of traditional organizational design features tend to discourage — and not encourage — change. Thus, to transform themselves into organizations that are “built to change,” companies need to rethink a number of these basic design assumptions.

Managing Talent Job descriptions are emblematic of stability and as a result are a poor fit for any built-to-change organization. Of course, job descriptions can be updated (although companies tend to be slow in doing that), but why go to the trouble of specifying job responsibilities in the first place only to have to tell employees that their latest assignment comes under the rubric “other duties as assigned”? Instead of telling employees what their jobs are, built-to-change organizations encourage people to find out what needs to be done. In lieu of job descriptions, frequent goal-setting reviews help establish what individuals and teams are expected to accomplish in the near future. Cascading throughout the organization, this process can be facilitated by an intranet-based performance management system.

When hiring people, built-to-change organizations seek individuals who like change and are quick learners. That’s why companies like Southwest Airlines, Nike and W.L. Gore & Associates specifically look for people with initiative and the right attitude, including the desire for professional growth. Built-to-change companies need to have an employment contract that states that change is to be expected and that support for change is a condition of long-term employment.

One of the best things that former CEO Lou Gerstner did when he began IBM Corp.’s massive

Many executives talk about the need for greater flexibility and adaptability from their companies. But the truth is that most businesses have organized themselves in ways that inherently discourage change.

transformation was to redefine the relationship between company and worker. Previously, IBM had a policy of lifetime employment, but Gerstner changed that to employment for as long as an individual has the required skills and knowledge. Of course, people should be made aware of this type of employment deal before they're hired, so they can make an informed decision about whether they want to work in such an environment. Once they join, training should be a normal, ongoing process,

In work environments that call for changing task assignments, paying the person — as opposed to paying the job — is a much more effective approach. People have a market value; jobs do not.

focused on the skills and knowledge necessary to support change and other organizational capabilities, and aimed at the competencies that will help the company add value both now and in the future. Much of that training can be delivered “just in time” over an intranet.

Reward System Pay and other rewards that are based on seniority stifle change. They do little but reward people for surviving. Built-to-change organizations utilize a variety of reward practices — including bonuses, stock and “person-based pay” — that encourage both current performance and change. Bonus systems can be particularly effective motivators during periods of change by establishing a clear line of sight between results and rewards. Individual plans that offer relatively large bonuses can provide powerful incentives for employees to perform well and to alter their behaviors when a new element of strategic intent calls for it. Group and business-unit bonuses can be very helpful in focusing team performance and in creating a shared need for change.

In some circumstances, companies should consider one-time bonuses awarded at the completion of a strategic change effort. Members of a new-product development team, for example, could be given bonuses when the product ships. In other tactical change situations, short-cycle bonus periods (perhaps every three months) that target phases in the “implementation” of change often make more sense, for example, to reward an information

technology team that hits key milestones in a project for installing a new system.

In comparison to bonuses, stock plans are likely to be less effective in motivating change because the line of sight between the desired behavior and reward is less clear. But broad-based stock ownership can provide executives with a better platform on which to stand and talk about the advantages of change than a stock program that includes just those people in the corner offices. When only senior managers have stock options, employees cannot be faulted for thinking, “Why should I listen to calls for change that benefit those only at the top?”

Finally, companies should consider shifting the basis of pay from the job (and seniority) to the individual (and what he or she can do). In work environments that call for changing task assignments, paying the person — as opposed to paying the job — is a much more effective approach, particularly when it comes to retaining the right people. After all, people have a market value; jobs do not. People can change companies for higher pay; jobs cannot.

Perhaps the most important benefit of person-based pay is the effect it has on organizational culture and on employees' motivation to change. Instead of the company rewarding people for expanding their jobs or for moving up the hierarchy, it recognizes them for increasing their skills and for their added expertise. That reinforces a culture that values growth and personal development; the result is a highly talented work force that is receptive to change. Those characteristics are particularly valuable when an organization needs to improve its competencies and capabilities, because the company can adjust its reward system to encourage individuals to develop the necessary skills.

The implementation of a person-based pay system must start with a clear model of the competencies required to meet current customer and environmental demands, as well as a notion of the kinds of skills and knowledge that employees will need in the future. This information can guide professional development activities that are tied to the reward system. One indirect effect of person-based pay is a decreased emphasis on hierarchy, because individuals don't need to be promoted to

receive a significant raise. Instead, they can develop a new expertise. Among the positive results of that change are fewer individuals jostling for promotions merely because they want higher salaries.

Organization Structure Built-to-change organizations must be in close touch with market and other environmental demands to define and redefine continually a series of short-term competitive advantages. To achieve that, all employees — not just senior managers — must observe and report on market trends and identify competitive opportunities. They need to think constantly about potential alternative futures, creating a variety of short- and long-term scenarios. Instead of scheduling static annual reviews of the environment, built-to-change companies must adopt flexible and reconfigurable organizational structures.

The key design principle here is to maximize the “surface area” of the organization by connecting as many employees as possible with the external environment. Structures that accomplish this increase the external focus of its members; bring in critical information about trends, opportunities and issues; and prevent people from becoming ossified in their roles. Thus, as many employees as possible should have contact with regulators, suppliers, the local community, watchdog groups and, most importantly, customers. Built-to-change companies are concerned about being caught off-guard, so they place everyone close to customers and the environment. That way, when the time comes to alter the direction of the organization, everyone moves together based on a common understanding and felt need for the change.

A variety of companies, including IBM, Nokia, health care corporation Healthways, based in Nashville, Tennessee, and Lord, an adhesives manufacturer in Cary, North Carolina, have increased their surface area by adopting front-back, process-based or network structures that increase the centrality of customer and other external demands. In addition to coordinating functional, product, service and geographic issues, these multidimensional structures continually ask employees to consider the interests of customers and other outsiders in the decision-

making process. For example, the “front end” of a front-back organization creates flexible, cross-functional and customer-facing teams to configure and sell unique products, services and systems. The “back end” develops new technologies, products and systems; maintains the supply chain; and conducts other activities that support the front end. As a result, customer requirements, supplier relationships and other environmental demands have an ever-present influence (either directly or indirectly) on nearly everyone in the organization.

In a process-based structure, cross-functional teams address the requirements of both internal and external customers. At Healthways Inc., for instance, each core process — understanding the market, developing new businesses, building solutions or delivering value — must balance current demands for efficiency with future market needs. Although each process within the organization might have a slightly different focus, successful execution requires the application and coordination of each function in service of customer requirements and corporate objectives.

Network structures consist of individual organizations (or units within a company) that have been pulled together to exploit specific opportunities. An integrating entity coordinates the activities of the different parts, much as a studio assembles and coordinates the work of actors, screenwriters, camera crews and others necessary to create a movie. In general, a network structure leads to or-

ganizations with large surface areas because of all the alliance relationships that managers and employees must address.

Other companies have maximized their surface area by deploying multiple independent business units, outsourcing and matrix relationships. For instance, Berkshire Hathaway Inc., with its wide range of autonomous business units in multiple markets, can adjust its corporate portfolio relatively easily without the angst and grief associated with traditional downsizings and re-sizings of in-

tegrated divisions. Similarly, W.L. Gore & Associates Inc.'s small, interrelated divisions ensure that each unit is maximally exposed to its relevant market. Internal matrix relationships can also increase an organization's surface area because, when employees from different functions or programs interact, they often must deal with a variety of alternative market perspectives.

Information and Decision Processes Annual budgets are a poor fit for a built-to-change organization because they are typically inflexible and frequently outdated even before they can be put in place. There is no reason why the setting of spending patterns should be based on the time it takes for the earth to revolve around the sun. Instead of relying on annual budgets to control costs, built-to-change companies should deploy profit centers and activity-based costing. Whenever possible, a profit and loss should govern each business unit. To ensure good decision making, information needs to be transparent and up-to-date, indicating the current condition of the

it helped people to align their individual behaviors with corporate objectives. The system thus facilitated the goal-setting, performance review and reward process.

Leaders Executives in built-to-change organizations need to practice shared leadership — what Mark Hurd, the CEO of Hewlett-Packard Co., has described as, “leadership as a team sport.” Viewing CEOs at the helm of a big ship setting direction and ordering people around is the wrong image. It might be appropriate for traditional hierarchical organizations, but it does not fit a built-to-change organization. A better metaphor is to think of the corporation as a community of people spread over miles of hills, fields and forests. To get everyone moving in a new direction, competent leaders need to be dispersed across the countryside, all connected by a shared sense of identity and purpose.

Shared leadership has three advantages. First, it effectively substitutes for hierarchy. Spreading knowledge and power across many people allows

the organization to process and respond to information quickly without requiring a tremendous amount of top-down direction. Second, a shared approach builds a deep cadre of leadership talent. By involving everyone in

organization's capabilities and providing a clear view of how the company is performing relative to its competitors and its strategy.

Performance-based information systems are a particularly effective way to motivate and empower employees in a built-to-change organization because they facilitate moving decision making to wherever decisions can best be made and implemented. A good example is mySiebel, a personalized information system created by Siebel Systems Inc. before its acquisition by Oracle Corp. Each employee could log onto mySiebel and gain access to corporate, market and competitor information; data on current projects; and quarterly objectives for any individual in the organization (including Tom Siebel, the CEO). This widely available information allowed everyone throughout the organization to make customer-related decisions with the most up-to-the-minute data available, and

strategizing, creating value and other activities typically performed mainly by senior execs, a company can develop leadership and management skills among a broad audience. Third, multiple leaders at all levels who understand the external environment and the internal capabilities of the organization often see important trends that call for corporate change before senior management does. Most importantly, shared leadership supports more effective change management. In any change effort, there is typically more to do than a single person or a few leaders can handle. Shared leadership helps to solve that problem. Also, change efforts that are led by a single hero leader are fragile entities; if that individual falters or leaves, the change effort stalls. With shared leadership, competent personnel are always available to keep the momentum going.

To develop a shared leadership capability, a com-

pany has to implement a program for leadership development that involves many employees and not just a few “stars.” It also needs to share strategy information and business results with managers at all levels. Finally, it needs to obtain input continually from employees to develop and evolve its business strategy. When former CEO Lou Gerstner was implementing a massive change effort at IBM, for instance, he regularly led Web-based discussions to solicit feedback from employees.

IT’S EASY TO UNDERSTAND WHY MOST MODELS of organizational design tend to stress stability — they were born in an age when environments were relatively stable or at least predictable. When the environment changed slowly or predictably, those models worked well. But the pace and uncertainty of change in today’s world, spurred by increased globalization and technological innovation, among other factors, strongly argues for a new approach.

What is needed is an organizational effectiveness model built on the assumption that continuous change is simply business as usual. Such a model requires the right approach to strategy. Instead of seeking a single sustainable advantage, built-to-change companies must continually pursue a series of short-term competitive advantages. Moreover, to create value over time, they must constantly ask themselves the right questions. Instead of “What do we do well?” they must ask “What do we need to learn?”; “How do our current capabilities need to evolve?”; and “What new capabilities do we need to develop?” In answering those questions, built-to-change companies must constantly balance resource allocations for present performance against investments that will create future fitness. These trade-offs will be made through make-or-buy decisions to add, modify or eliminate certain capabilities. And the execution of those decisions will be greatly aided — or hampered — by a company’s organizational design. Simply put, corporations with the right structure, employees, rewards, leaders and information systems will be equipped to implement the necessary changes while those that lack them will tend to stumble.

Christopher G. Worley is a research scientist at the Center for Effective Organizations at the University of Southern California Marshall School of Business and an assistant professor in Pepperdine University’s Master of Science in Organization Development program. Edward E. Lawler III is the director of the Center for Effective Organizations and distinguished professor of business, also at the Marshall School. Their book, Built to Change: How to Achieve Sustained Organizational Effectiveness, was published by Jossey-Bass this year.
